## Taisu Energy Technology CO.,LTD

From cradle to cradle, the green economy is opened by Taisu

Tai Su Energy Tech was founded in 1992, in the related professional technologies of dyeing and finishing, setting, drying, gluing, calendaring, etc., we have accumulated and possessed a variety of rich experiences. Today's business scope has covered the five major fields of "dyeing and finishing, printing and dyeing, energy, cloth sales, and polyester waste recycling and granulation", and has achieved a large-scale cradle-to-cradle cycle of recycling to ensure that every next generation has a better planet.

We have our own knitting, dyeing, setting, brushing, printing machinery, and lab set up in Taiwan. Our major products are stapled and filament knitted fabrics, including polyester, nylon, Polyester/Cotton, and TCD with spandex. We mainly specialize in professional stretch knit fabrics along with numerous functions (moisture management, anti-UV, anti-bacteria, deodorization, cooling, keep warm ---etc.) that are all approved by international brands, and we also customize our fabrics to meet our clients' demands.

Our company uses a patented twin-screw kneader combined with a compound process of a polymerization tank. In this process, only new materials need to be added at the beginning, and after the second batch of recycled materials is put into the process, there is no need to add new materials. The ester pellets produced by this process can achieve the goal of using 100% recycled materials and greatly reduce the use of new plastics.
